

Clinical Brief

Patient ID: P004

Alert Summary

trigger: Blood pressure reading of 168/102 mmHg detected by Omron BP Monitor, exceeding threshold of 140/90 mmHg

severity_class: ELEVATED

severity_score: 6

timestamp: 2026-05-14T11:00:00Z

Patient Snapshot

patient_id: P004

demographics: Demographics not available in EHR

active_conditions

- Hypertension (active, ICD10: I10, duration unknown)

current_medications

- Amlodipine (dose and frequency unknown)

contextual_analysis: The patient is a recent transfer with a self-reported history of hypertension and is currently taking Amlodipine, though the dose and frequency are unknown (EHR, Anamnesis). The elevated BP reading of 168/102 mmHg is significantly above the threshold and is accompanied by a mild occipital headache, but no other symptoms such as chest pain or vision changes were reported (Anamnesis). There are no prior BP trends, baseline vitals, or recent labs available due to incomplete transfer records (EHR).

risk_assessment: This elevated blood pressure may suggest suboptimal control of hypertension or possible medication underdosing, especially given the uncertainty about the current regimen.

The mild headache could indicate early symptoms of hypertensive urgency, but absence of severe symptoms may indicate no immediate end-organ damage.

recommended_actions

- - action: Consider confirming current Amlodipine dose and frequency with patient and prior provider
 - confidence: 0.9
 - source: EHR + Anamnesis
- - action: Suggest repeat BP measurement in clinic and assess for additional symptoms
 - confidence: 0.85
 - source: Alert + Anamnesis
- - action: Request and review full prior medical records to clarify hypertension history and prior management
 - confidence: 0.95
 - source: EHR

uncertainties_and_gaps

- Patient demographics (age, gender) not available
- Exact dose and frequency of Amlodipine unknown
- No recent labs or baseline blood pressure/heart rate documented
- No prior BP readings or trends available
- Smoking status, alcohol use, and detailed lifestyle factors missing
- Family history details (relation, age of onset) incomplete
- No documentation of cardiovascular or renal disease in current records
