

Clinical Brief

Patient ID: P005

Alert Summary

trigger: Blood pressure 162/98 mmHg detected by home monitor, above threshold of 140/90, with conflicting data: patient claims adherence but labs show sub-therapeutic Ramipril levels.

severity_class: ELEVATED

severity_score: 6

timestamp: 2026-05-14T12:00:00Z

Patient Snapshot

patient_id: P005

demographics: Demographics not available in provided EHR data

active_conditions

- Hypertension (active, since 2019)

current_medications

- Ramipril 10mg daily
- Metformin 500mg twice daily

contextual_analysis: The patient has a history of hypertension managed with Ramipril and Metformin (EHR). Despite reporting perfect adherence to both medications (Anamnesis), recent labs on 2026-04-15 showed sub-therapeutic Ramipril levels (EHR), and the current BP reading of 162/98 mmHg is elevated (Alert). The patient expresses frustration about persistent high BP and denies missed doses (Anamnesis), but the discrepancy between reported adherence and drug levels has been previously noted and discussed (EHR, Anamnesis).

risk_assessment: Persistently elevated BP in the context of sub-therapeutic drug levels and reported adherence may suggest issues with medication absorption, compliance, or possible drug interactions. This could indicate increased risk for hypertensive complications if not addressed.

recommended_actions

- - action: Consider direct observation of medication administration or pharmacy refill review to clarify adherence
 - confidence: 0.9
 - source: EHR + Anamnesis
- - action: Suggest evaluation for possible causes of reduced drug absorption or drug-drug interactions
 - confidence: 0.8
 - source: EHR
- - action: Recommend repeat blood pressure and Ramipril drug level testing within 1-2 weeks
 - confidence: 0.85
 - source: Alert + EHR

uncertainties_and_gaps

- Patient demographics (age, gender) not available
- No recent weight or BMI data
- Incomplete documentation of other active conditions
- No detailed sodium intake or dietary history
- No information on use of over-the-counter, herbal, or non-prescription drugs
- No recent medication changes documented
- No recent changes in physical activity or stress level documented
- No additional recent blood pressure trends beyond current and two prior readings
